## 6. TROUBLESHOOTING

Problem	Possible Causes	Check/Remedy
Meter indication is blank	No power	Check power light.
	Blown fuse	Check fuse.
	No power to instrument	Check for proper voltage on
		terminals 8 & 9.
	Faulty transmitter/indicating meter	Refer to supplier.
Meter will not zero	Too much absorbed light	Remove sensor and place in clean
		water. If the meter does not zero
		then try adjusting CS (course zero)
		on the circuit board.
	Poor sensor connections or incorrect wiring	Check connections and wiring.
	Sensor leads not insulated from body of sensor or conduit	Check sensor wires.
	Wet connection in converter or	Look for water or condensate on
	sensor housings	connections.
	No power to sensor	Voltage should be 7-10 VDC
		between terminals 5 and 6 on the
		main circuit board. Also, there
		should be 6-9 VDC on terminals 5
		and 6 of the circuit board in the sensor.
	Faulty sensor bulb or defective	If the proper voltage (8-11 VDC) is
	sensor/transmitter	on terminals 5 and 6 and the bulb
		in the sensor is not on, then the
		bulb has failed.
No response (indication does not	Faulty sensor bulb	Check to see if sensor lamp is on.
change and indication is high)		If lamp is off, check voltage across
		terminals 5 & 6 in sensor. If the
		proper voltage (8-11 VDC) is on
		terminals 5 and 6 and the bulb in
		the sensor is not on, then the bulb
		has failed.
Unstable reading	Insufficient dampening	Increase dampening.
	Air bubbles or very large particles	Take sample and check for bubbles
	in process line	or large particles. If present,
		relocate sensor.
	RFI pickup	Earth ground instrument properly.
	Heavy Inductive loads	Mount instrument away from power
		cables. Put cables in conduit.
Reading does not agree with lab results	Improper calibration	Recalibrate instrument.
results	Lab procedure error Lab instrument error	Check procedure. Check instrument.
	Defective sensor/transmitter	Refer to supplier.
Readings drift with time	Converter not warmed up	Warm up converter for 15 minutes.
neadings drift with time	Sensor/converter connections wet	Look for water or condensate on
		connections. Dry connections with
		hair dryer.
	Deposit build-up on sensor	Remove sensor and clean.
Negative readings or negative	Improper calibration	Recalibrate instrument.
